

MERN stack assessment-

Implement a dummy staffing system containing the vendor and resource details. The application should meet the below requirements-

1. Create a form to enter the Vendor details having only one field-Vendor name (text input field) and a submit button to submit this data.
2. Create another form to enter the resource details which will contain the following fields-Full Name, Upload Resume, Vendor Name, Technology and Submit button.
The full name will be a text input field, Upload Resume will be having the file upload functionality, and Technology will be a checkbox field where the user can select multiple options. Vendor names will be a dropdown list which will auto-populate all the vendor names from the vendor database.
3. Create databases for the above two forms and feed the corresponding data to their respective tables. Fetch all data from the resource table and display that on the screen on a separate dashboard page.

There are no restrictions on how the page should be laid out and styled. Be as creative as you wish, with a focus on user experience. Feel free to include CSS frameworks or other libraries that are helpful to you.

For accessing the reference screen for resource details form, visit the below link-
